

Local File Transfer Application - Setup Guide

Prerequisites

Install:

- Node.js (v20 or later)
- npm
- Git

Optional:

- VS Code
 - Docker
-

Installation

Clone the repository.

Install backend dependencies.

Install frontend dependencies.

Create a `.env` file with:

- PORT
- DEVICE_NAME
- UPLOAD_DIRECTORY
- MAX_UPLOAD_SIZE

Start the backend server.

Start the frontend development server.

Open the application in your browser.

Mobile Connection

1. Connect your phone and laptop to the same Wi-Fi network.
2. Launch the application on the laptop.
3. Scan the displayed QR code using your phone.
4. The phone will open the transfer interface in its browser.

5. Approve the connection if prompted.

Firewall

Allow the application through the operating system firewall.

Open the configured port (default: 3000).

Production Build

Build the frontend.

Serve the production build from the backend.

Optionally package the application using Electron or another desktop framework to create a standalone executable.

Troubleshooting

Phone cannot connect

- Ensure both devices are on the same Wi-Fi network.
- Verify the firewall is not blocking the application.
- Confirm the displayed IP address is correct.

Slow transfers

- Use a 5 GHz Wi-Fi connection if available.
- Avoid transferring while the network is heavily used.
- Ensure both devices have sufficient storage space.

Upload fails

- Check the configured maximum upload size.
- Verify write permissions for the upload directory.
- Ensure enough free disk space is available.
